

setfill function

The *setfill* function is a member of the `<iomanip.h>` header file. This function allows to replace the blank spaces in a set field width to any character you want. For example:

```
#include <iomanip.h>

int main ()
{
    int x = 23;

    cout << setiosflags(ios::right) << setw(5) << setfill('0')
         << x << endl;
}

// Output will be: 00023
```

The *setfill* function takes a *char* data type.
